

Focus on high income and total return through global value stocks and call options

Strategy overview

The Fund combines an actively-managed quantitative equity investment strategy with a call writing option strategy, seeking to create a diversified portfolio with enhanced total return potential and strong downside capture over a full market cycle.

Performance

For the quarter, the Voya Global Advantage and Premium Opportunity Fund provided a total return of 4.17% on a net asset value (NAV) basis and a total return of 7.27% on a market price basis. For the same period, the Fund's reference Index, the MSCI World Value Index, returned 9.30%.

Equity portfolio

During the quarter, the Fund's equity sleeve underperformed the Index. Out of the three primary return drivers for the sleeve (proprietary core model, beta and dividend yield), the core model contributed along with the higher dividend yield position but the low beta positioning eliminated the positive impact from the other drivers, as speculative high beta stocks drove returns in the benchmark. Within the proprietary core model, three out of five pillars had a positive impact on relative returns with the sentiment indicator contributing the most.

On the regional level, portfolio holdings in the Japanese region contributed whereas holdings in the North American region detracted.

On the sector level, stock selection in the energy sector contributed the most to results. Among the key individual stock contributors were not owning Exxon Mobil Corp. and Berkshire Hathaway Inc. Class B and the underweight in Chevron Corp.

By contrast, stock selection in the financials, information technology and industrials sectors detracted. Among the key detractors were not owning Broadcom Inc. and Intel Corp. and the Fund's non-benchmark position in Aon PLC Class A.

Option portfolio

During the quarter, the Fund's option strategy had a negative impact on returns. The strategy seeks to generate premiums and retain some potential for upside appreciation. The Fund implements this strategy by typically writing call options on regional indices, the selection and allocation of which resulted from an optimization intended to track the reference Index of the Fund closely. The strike prices of the options written were typically out of the money or near the money with expiration dates around six weeks at inception.

Outlook and current strategy

U.S. equity markets bounced back during the month, bolstered by economic resilience, waning inflation and another pause in the U.S. Federal Reserve's interest rate hiking cycle. The S&P 500 Index rose by 4.54% and the Nasdaq Composite Index advanced by 5.52%. Information technology stocks led while utilities lagged. Growth stocks outperformed value stocks during the month, and small caps had a significant lead over large caps.

The U.S. bond market rallied in December. The Bloomberg U.S. Aggregate Bond Index gained 3.83% on the unexpected strength of the economy. The 10-year U.S. Treasury yield moved from 4.22% at the beginning of the quarter to 3.88% by quarter-end as inflation eased and expectations of interest rate cuts in 2024 grew.

In our view, the side effects of the pandemic shock have mostly subsided, and inflation is the final piece of the puzzle. We view the recovery not as a classic business cycle, but as an economy trying to normalize following a natural disaster. First came the government-mandated lockdowns and the bust. Then came the re-openings and the effects of mega-policy stimulus. Lastly came the 180-degree reversal in monetary policy. Inflation peaked in June 2022 at 9.1%, which means that most of the disinflation we have seen since then has had little to do with Fed policy. We believe that disinflation could continue (and may intensify) over the next 18 months. Corporate earnings are accelerating as the U.S. consumer remains healthy and corporate fundamental factors are sound.

China continues to disappoint. There was little (if any) reopening burst of activity, and economic growth is slowing, with retail sales, industrial production and fixed investment all coming in lower than expected. Exports have plunged, due in part to U.S. companies' efforts to re-shore or move offshored manufacturing elsewhere. Furthermore, China's real estate sector, their main growth engine, is in freefall, with multiple large property developers teetering on the edge of default. However, the country continues to make progress on the technological front (for example, semiconductor chips, electric vehicles, aerospace, etc.). While valuations are at deep discounts (and the government has signaled it may intervene with a stabilization fund to buy stocks), the outlook for Chinese equities remains uncertain. Although other emerging market (EM) countries have better near-term prospects, it is difficult to be bullish on EM equities overall when China is lagging.

Given these uncertainties in the global market outlook, we expect the Fund to continue to benefit from its option-writing activities.

Holdings detail

Companies mentioned in this report — percentage of Fund investments, as of 12/31/23: in Exxon Mobil Corp. 0%, Chevron Corp. 1.43%, Berkshire Hathaway Inc. 0%, Broadcom Inc. 0%, Intel Corp. 0% and Aon PLC Class A. 0.47%; 0% indicates that the security is no longer in the portfolio. Portfolio holdings are subject to change daily.

Disclaimer

The **MSCI World Value Index** captures large- and mid-cap equity securities exhibiting overall value style characteristics across 23 developed market (DM) countries. The value investment style characteristics for index construction are defined using three variables: book value to price, 12-month forward earnings to price and dividend yield. **Investors cannot invest directly in an index.**

Past performance is no guarantee of future results. The performance quoted represents past performance. Current performance may be lower or higher than the performance data quoted. All investing involves the inherent risks of fluctuating prices and the uncertainties of rates of return and yield. Investment return and principal value of an investment will fluctuate, and shares, when sold, may be worth more or less than their original cost.

Total investment return at market share price measures the change in the market value of your investment assuming reinvestment of dividends, capital gain distributions and return of capital distributions/allocations, if any, in accordance with the provisions of the Fund's dividend reinvestment plan. Total investment return at market share price is not annualized for periods less than one year. Closed-end funds such as the Fund do not continuously offer shares for sale and are not required to buy shares back from investors upon request. Shares of closed-end funds trade on national stock exchanges. Market share prices therefore are not directly affected by Fund expenses or fees, which ordinarily have the effect of lowering total return.

Total investment return at net asset value has been calculated assuming a purchase at net asset value at the beginning of the period and a sale at net asset value at the end of the period; and assumes reinvestment of dividends, capital gain distributions and return of capital distributions/allocations, if any, in accordance with the provisions of the dividend reinvestment plan. NAV is total assets less total liabilities divided by the number of shares outstanding. NAV is net of all Fund expenses, including operating costs and management fees. Total investment return at net asset value is not annualized for periods less than one year.

Principal risks: Price volatility, liquidity, and other risks that accompany an investment in equity securities of domestic and foreign companies, and small and mid-sized capitalized companies. International investing poses special risks including currency fluctuation, economic and political risks not found in investments that are solely domestic. Risks of foreign investing are generally intensified for investments in emerging markets.

Options risks: The Fund may purchase put and call options and may write (sell) put options and call options and is subject to options risk. The risk in writing a call option is that the Fund gives up the opportunity for profit if the market price of the security increases and the option is exercised. The risk in buying an option is that the Fund pays a premium whether or not the option is exercised. Risks may also arise from an illiquid secondary market or from the inability of counterparties to meet the terms of the contract. When an option is exercised or closed out, the Fund may be required to sell portfolio securities or to deliver portfolio securities to satisfy its obligations when it would not otherwise choose to do so, or the Fund may choose to sell portfolio securities to realize gains to offset the losses realized upon option exercise. Such sales or delivery would involve transaction costs borne by the Fund and might also result in realization of taxable capital gains, including short-term capital gains taxed at ordinary income tax rates, and could adversely impact the Fund's after-tax returns.

This Fund has **additional risks** that you should consider, such as market discount risk, investment and market risk, foreign investment and emerging markets risk, foreign (non-US) currency risk, Asia Pacific regional and country risk, issuer risk, equity risk, distribution risk, tax risk, dividend risk, small-cap and mid-cap company risk.

The Fund employs a quantitative model to execute its investment strategy. Data imprecision, software or other technology malfunctions, programming inaccuracies and similar circumstances may impair the performance of these systems, which may negatively affect performance. Furthermore, there can be no assurance that the quantitative models used in managing the strategy will perform as anticipated or enable the strategy to achieve its objective.
